

POP-UP Sprinkler

Abbreviation : POP		Materials: PE	
			

Product description

Buried pop-up sprinklers. It means that except for the sprinkler cover, all the rest are placed underground. In the non-working state, the top of the sprinkler is at the same height as the ground. Movement and walking on the ground do not cause obstacles, do not affect the landscape effect, and do not hinder the work of lawn mowing and cleaning machinery. When the nozzle is working, the rotating part of the nozzle is ejected by the water pressure in the pipeline, and the nozzle is extended out of the ground for spraying. When the water source is turned off, the water pressure disappears, and the rotating part of the nozzle retracts to its original position under the action of the spring. Different turf and green spaces can choose buried sprinklers with different pop-up heights. There are many additional accessories for golf course-specific buried sprinklers, such as drainage devices in the protective shell, decompression and overflow prevention devices, and filters.

Features

The grass green box (top cover) is integrated with the greening, beautiful, easy to operate, durable, and does not affect the landscape effect

Product application

Widely used in parks, golf, gardens, highways, etc.
